SMART CAMPUS AND STUDENT EXPERIENCE

APFoods + FIF AI

Campus meals that work around student life

Connected ordering.
Evidence-based campus dining decisions.

The lunch break becomes another queue

Students have limited time between classes. Uncertain ordering and pickup consume that break.

01 Students cannot plan confidently

Menu discovery, meal choices and pickup timing require too much guesswork.

02 Stalls receive uneven demand

A busy counter and a quiet counter have little shared visibility of what comes next.

One connected service, two core strengths

APFoods

The campus meal journey

Stall discovery, menus, baskets, pickup scheduling and collection in one connected workflow.

FIF AI

Food Intelligence Framework

Student assistance and evidence-based recommendations for vendors and campus administrators.

A meal journey students can plan

01 Find a meal

Explore stalls and menus, then build a basket.

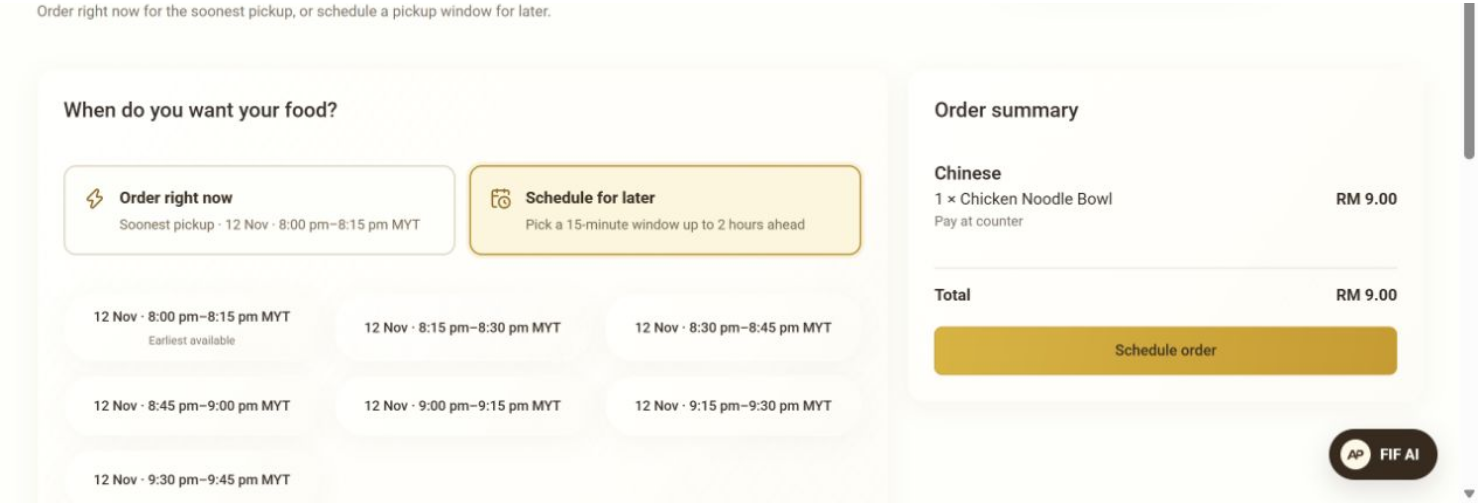

02 Choose pickup

Select a shared available 15-minute window.

03 Track and collect

Follow preparation and collect with a one-time code.

Scheduled pickup in APFoods

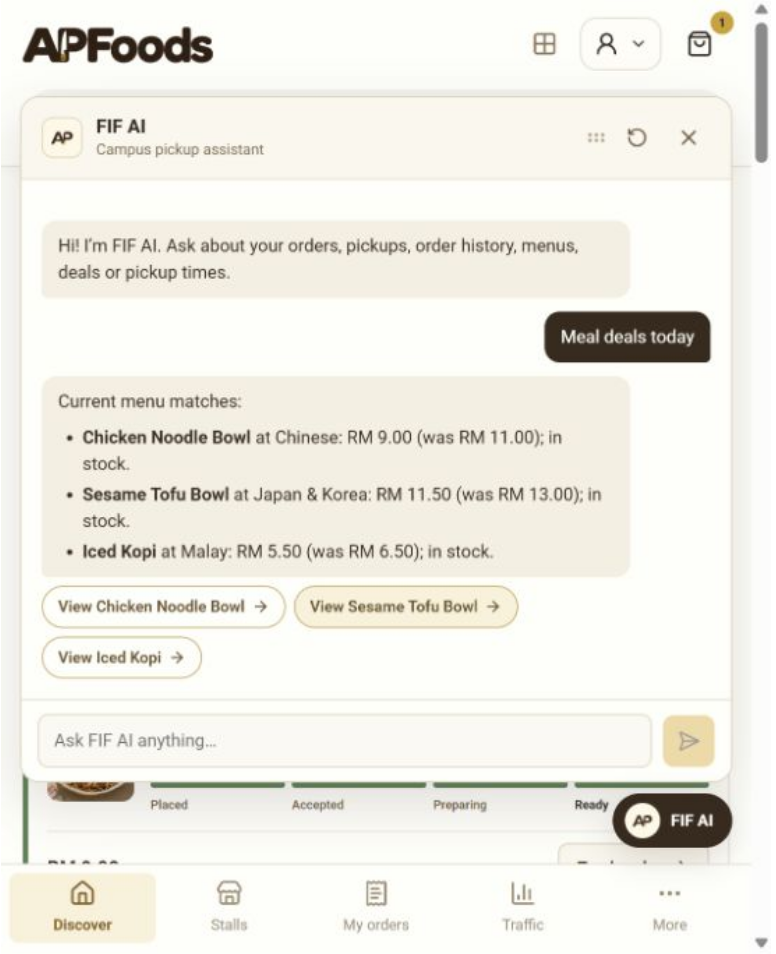

Students choose from available kitchen capacity.

FIF AI helps students choose and act

“What can I get for under RM10?”

FIF uses current menus and prices to answer, then links the student to a relevant meal.

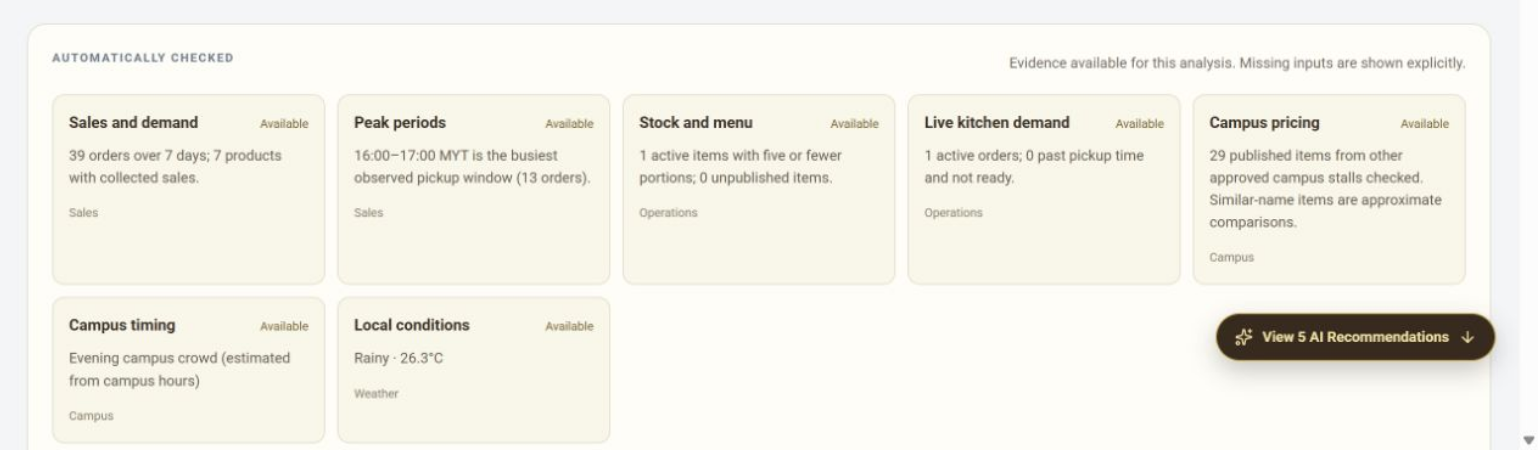

Order status and pickup advice
Meal deals and budget questions
Cart additions after confirmation

FIF AI helps stalls prepare for demand

Seven automatic inputs

Sales, peak periods, stock, live kitchen demand, campus prices, campus timing and local conditions.

Useful next actions

Prepare for the peak
Review low stock
Clear late preparation
Test a menu change

FIF AI gives campus teams a shared view

01 See where support is needed

Review stall performance, stock issues, pickup demand and fulfilment exceptions.

02 Ask an operational question

“Which vendor needs attention today?” uses authorised campus evidence.

03 Compare a proposed response

Review recommendations and optional impact assumptions against recorded baselines.

Latest admin implementation: Keyaan

FIF recommendations start with evidence

01 **APFoods captures the operational context**

Orders, menus, available stock and booked pickup capacity.

02 **FIF reads within the user’s role**

Student information, a vendor’s stall or authorised campus aggregates.

03 **People keep control of meaningful changes**

Student cart additions and vendor updates require confirmation. Admin chat stays read-only.

Smart Campus starts with an everyday need

Student Experience

Clear meal choices
A pickup time students can plan around
Useful assistance when they need it

Smart Campus

Dining activity becomes evidence
for better campus service decisions.

What the current system demonstrates

Implemented workflows

Role-based accounts
Ordering across campus stalls
Capacity-aware pickup and collection
FIF support for all three roles

Next validation

Campus use and time saved
Peak-period service reliability
Payment integration
Deployment rehearsal

Demonstration transactions establish workflow behaviour, not campus adoption or measured impact.

PROPOSED NEXT STEP

A focused campus pilot can test the value

One cafeteria. Participating stalls. A student cohort.

01 Student time

Compare ordering-to-collection time and pickup punctuality with a baseline.

02 Student experience

Track repeat use, successful collection and a short post-pickup rating.

03 Vendor operations

Track late preparation, missed pickups and cancelled orders.

04 FIF usefulness

Record accepted suggestions and the outcomes that follow.

APFoods + FIF AI

A better meal journey.
Smarter campus decisions.

Next step: a campus dining pilot
